

Diagnosis:

Resected ileocolic section with an ulcerated colon carcinoma characterized histologically as a moderately differentiated, partly mucinous rectal adenocarcinoma, located 3 cm aborally to Bauhin's valve, encircling the intestinal wall at a length of 12 cm. Invasive spread of the tumor within all intestinal walls up to the bordering subserous connective tissue and mesocolic fatty tissue. Continuing infiltration to an angular colon section adhering to the tumor. In addition, colon mucous membrane with five sessile serrated adenomas.

The tumor stage is therefore: pT4 pN0 (0/22) L0, V0; G2 R0.
