

*** Diagnosis / Diagnoses: ***

24-cm-long resection of the colon under inclusion of a poorly differentiated, largely ulcerated adenocarcinoma, of a maximum of 3.5 cm in diameter and of the colorectal type, with infiltration of the pericolic fatty tissue (pT3; G3). Tumor-free resection margins of the colon. Three tubular adenomas in the colonic mucosa with low- to moderate-grade dysplasia in the remainder.

A follow-up report will be made on the lymph node status.

Follow-up report:

A total of 28 histologically tumor-free lymph nodes of a maximum of 0.8 cm in diameter were determined after acetone fixation.

Final tumor stage: pT3 pN0 (0/28) pMX; G3
