

This is an unequivocal finding in the sense of an adenocarcinoma of the colon with extensive necrosis and poor differentiation (thus corresponding to G3) with penetration of all parietal layers and vascular infiltration (thus corresponding to pT3, L1, V1) with free resection margins in the mucosal region with a regular mucosa, submucosa and muscularis and free resection margins in the mesenchymal region and three lymph node metastases (corresponding to pN1). In addition, there were diverticular formations.

Tumor classification:

ICDO-DA-M

G 3

pT3

L1, V1

pN1 (3 of 13 lymph nodes)
