

Light microscopic findings

1. In relation to histology, an advanced carcinoma in block A is visible in the material at hand, severely necrotic here. Tumor cells are classified in relation to a colic adenocarcinoma, specifically characteristic tubular formations, extensive necroses as well numerous nuclear atypia.

The tumor is penetrating all wall layers as well as vessels, consistent with p T 1, L1, V1.

Only granulation tissue is visible in the region of the serosa.
